

Sends alerts when the window is entered. More persistent alerts are sent between the calculated "frequent" to "average" payment dates Without knowing how to get live data. This is the natural stopping point. We will just ask if the payment has been made and then stop alorts.

transactions (date, if they have paid exalready) and then send alert at a specific time

A final alert can be sent at the end of the calculated window regardless of if the payment has been made. (sometimes we jure, say we did comething to get rid of the alert).

We should be able to tell if a full payment has been made. Not working on that atm

**Problems** 

**Solutions** 

Managing multiple credit cards

Bank statements are complicated

General Bank Problems Compile all credit card info to monitor each one

NLP to segregate expenses based on type. Eg: Food, entertainment, etc.
